Safety instructions for Ex areas
Take note of the Ex specific safety instructions for Ex applications. These instructions are attached as documents to each instrument with Ex approval and are part of the operating instructions.

Editing status: 2019-03-11
1 About this document

1.1 Function
This operating instructions provides all the information you need for mounting, connection and setup as well as important instructions for maintenance, fault rectification, the exchange of parts and the safety of the user. Please read this information before putting the instrument into operation and keep this manual accessible in the immediate vicinity of the device.

1.2 Target group
This operating instructions manual is directed to trained personnel. The contents of this manual must be made available to the qualified personnel and implemented.

1.3 Symbols used

Information, tip, note
This symbol indicates helpful additional information.

Caution: If this warning is ignored, faults or malfunctions can result.

Warning: If this warning is ignored, injury to persons and/or serious damage to the instrument can result.

Danger: If this warning is ignored, serious injury to persons and/or destruction of the instrument can result.

Ex applications
This symbol indicates special instructions for Ex applications.

List
The dot set in front indicates a list with no implied sequence.

Action
This arrow indicates a single action.

Sequence of actions
Numbers set in front indicate successive steps in a procedure.

Battery disposal
This symbol indicates special information about the disposal of batteries and accumulators.
2 For your safety

2.1 Authorised personnel
All operations described in this documentation must be carried out only by trained, qualified personnel authorised by the plant operator. During work on and with the device, the required personal protective equipment must always be worn.

2.2 Appropriate use
The CPT-2x is a pressure transmitter for process pressure and hydrostatic level measurement.

You can find detailed information about the area of application in chapter “Product description”.

Operational reliability is ensured only if the instrument is properly used according to the specifications in the operating instructions manual as well as possible supplementary instructions.

2.3 Warning about incorrect use
Inappropriate or incorrect use of this product can give rise to application-specific hazards, e.g. vessel overfill through incorrect mounting or adjustment. Damage to property and persons or environmental contamination can result. Also, the protective characteristics of the instrument can be impaired.

2.4 General safety instructions
This is a state-of-the-art instrument complying with all prevailing regulations and directives. The instrument must only be operated in a technically flawless and reliable condition. The operator is responsible for the trouble-free operation of the instrument. When measuring aggressive or corrosive media that can cause a dangerous situation if the instrument malfunctions, the operator has to implement suitable measures to make sure the instrument is functioning properly.

During the entire duration of use, the user is obliged to determine the compliance of the necessary occupational safety measures with the current valid rules and regulations and also take note of new regulations.

The safety instructions in this operating instructions manual, the national installation standards as well as the valid safety regulations and accident prevention rules must be observed by the user.

For safety and warranty reasons, any invasive work on the device beyond that described in the operating instructions manual may be carried out only by personnel authorised by the manufacturer. Arbitrary conversions or modifications are explicitly forbidden. For safety reasons, only the accessory specified by the manufacturer must be used.

To avoid any danger, the safety approval markings and safety tips on the device must also be observed and their meaning read in this operating instructions manual.
2.5 **EU conformity**

The device fulfils the legal requirements of the applicable EU directives. By affixing the CE marking, we confirm the conformity of the instrument with these directives.

2.6 **Permissible process conditions**

For safety reasons, the instrument must only be operated within the permissible process conditions. You can find detailed information on the process conditions in chapter "Technical data" as well as on the type label.

The permissible process pressure range is specified by "MWP" (Maximum Working Pressure) on the type label, see chapter "Structure". The MWP takes the element of the measuring cell and processing fitting combination with the weakest pressure into consideration and may applied permanently. The specification refers to a reference temperature of +20 °C (+68 °F). It also applies when a measuring cell with a higher measuring range than the permissible pressure range of the process fitting is installed order-related.

In order to prevent damage to the device, the test pressure may only exceed the specified MWP briefly by 1.5 times at reference temperature. The pressure stage of the process fitting as well as the overload resistance of the measuring cell are taken into consideration here (see chapter "Technical Data").

In addition, a temperature derating of the process fitting, e.g. with flanges, can limit the permissible process pressure range according to the respective standard.

2.7 **NAMUR recommendations**

NAMUR is the automation technology user association in the process industry in Germany. The published NAMUR recommendations are accepted as the standard in field instrumentation.

The device fulfils the requirements of the following NAMUR recommendations:

- NE 21 – Electromagnetic compatibility of equipment
- NE 53 – Compatibility of field devices and display/adjustment components
- NE 107 – Self-monitoring and diagnosis of field devices

For further information see www.namur.de.

2.8 **Installation and operation in the USA and Canada**

This information is only valid for USA and Canada. Hence the following text is only available in the English language.

Installations in the US shall comply with the relevant requirements of the National Electrical Code (ANSI/NFPA 70).

Installations in Canada shall comply with the relevant requirements of the Canadian Electrical Code.
3 Product description

3.1 Configuration

Scope of delivery
The scope of delivery encompasses:

- Instrument CPT-2x
- Documentation
  - Operating instructions CPT-2x
  - Characteristics test certificate
  - Instructions for optional instrument features
  - Ex-specific "Safety instructions" (with Ex versions)
  - If necessary, further certificates

Note:
Optional instrument features are also described in this operating instructions manual. The respective scope of delivery results from the order specification.

Scope of this operating instructions
This operating instructions manual applies to the following instrument versions:

- Hardware from 1.0.0
- Software version from 1.2.1

Note:
You can find the hardware and software version of the instrument as follows:

- On the type plate of the electronics module
- In the adjustment menu under "Info"

Type label
The type label contains the most important data for identification and use of the instrument:
Fig. 1: Layout of the type label (example)

1 Instrument type  
2 Field for approvals  
3 Signal output and voltage supply  
4 Technical data  
5 Product code  
6 Order number  
7 Serial number of the instrument  
8 Symbol of the device protection class  
9 ID numbers, instrument documentation  
10 Reminder to observe the instrument documentation

3.2 Principle of operation

Application area  
CPT-2x is suitable for applications in virtually all industries. It is used for the measurement of the following pressure types.

- Gauge pressure  
- Absolute pressure  
- Vacuum

Measured products  
Measured products are gases, vapours and liquids. Depending on the process fitting and measurement setup, measured products can be also viscous or contain abrasive substances.

Measured variables  
The CPT-2x is suitable for the measurement of the following process variables:

- Process pressure  
- Level
Measuring system pressure

Sensor element is the measuring cell with robust ceramic diaphragm. The process pressure deflects the ceramic diaphragm and causes a capacitance change in the measuring cell. This capacitance change is converted into an electrical signal and output as measured value via the output signal.

Fig. 3: Configuration of the ceramic measuring cell
1 Process diaphragm
2 Glass joint
3 Base element

The measuring cell is available in two sizes: Ø 28 mm and Ø 17.5 mm.

Measuring system temperature

Temperature sensors in the ceramic diaphragm and on the ceramic body of the Ø 28 mm measuring cell or on the electronics of the Ø 17.5 mm measuring cell detect the current process temperature. The temperature value is output via:

- The display and adjustment module
- The current output or the digital signal output

Extreme process temperature jumps are also immediately detected by the Ø 28 mm measuring cell. The values in the ceramic diaphragm are compared with that on the ceramic base body.

Within only a few measuring cycles the intelligent sensor electronics compensates unavoidable measurement deviations due to temperature shocks. Such shocks cause (depending on the set damping) only slight, brief changes to the output signal.
Pressure types

The measuring cell design depends on the selected pressure type.

Relative pressure: the measuring cell is open to the atmosphere. The ambient pressure is detected in the measuring cell and compensated. It thus has no influence on the measured value.

Absolute pressure: the measuring cell is evacuated and encapsulated. The ambient pressure is not compensated and does hence influence the measured value.

Seal concepts

The following presentations show examples for the installation of the ceramic measuring cell into the process fitting and the different seal concepts.

Recessed installation

The recessed installation is particularly suitable for applications with gases, vapours and clear liquids. The measuring cell seal is positioned laterally as well as in addition in front.

Front-flush mounting with single seal

The front-flush installation is particularly suitable for applications with viscous and abrasive media and in case of buildup. The measuring cell seal is positioned laterally.
3 Product description

![Diagram](image)

**Fig. 5: Front-flush installation of the measuring cell (example: thread G1½)**

1. Seal for the process fitting
2. Measuring cell
3. Seal for the measuring cell
4. Process fitting
5. Diaphragm

**Completely front-flush mounting with single seal**

The completely front-flush mounting is particularly suitable for applications in the paper industry. The diaphragm is in the pulp flow, is hence cleaned and protected against buildup.

![Diagram](image)

**Fig. 6: Front-flush installation of the measuring cell (example: M30 x 1.5)**

1. Measuring cell
2. Seal for the measuring cell
3. Seal for the process fitting
4. Process fitting
5. Diaphragm

**Front-flush mounting with double seal**

The front-flush installation is particularly suitable for applications with viscous media. The additional, front sealing protects the glass joint of the measuring cell against chemical attack and the measuring cell electronics against diffusion of aggressive gases from the process.

![Diagram](image)

**Fig. 7: Front-flush installation of the measuring cell with double seal (example: flange connection with extension)**

1. Measuring cell
2. Seal for the measuring cell
3. Process fitting
4. Additional, front seal for measuring cell
5. Diaphragm
Installation in hygienic fitting

The front-flush, hygienic installation of the measuring cell is particularly suitable for food applications. The sealings are installed gap-free. The form seal of the measuring cell protects also the glass joint.

![Fig. 8: Hygienic installation of the measuring cell (example: hygienic fitting with compression nut)]

1. Measuring cell
2. Form seal for the measuring cell
3. Gap-free seal for process fitting
4. Process fitting
5. Diaphragm

Installation in hygienic fitting acc. to 3-A

The front-flush, hygienic installation of the measuring cell acc. to 3A is particularly suitable for food applications. The sealings are installed gap-free. The additional front sealing for the measuring cell protects also the glass joint. A hole in the process fitting is used for leakage detection.

![Fig. 9: Hygienic installation of the measuring cell acc. to 3-A (example: Clamp connection)]

1. Measuring cell
2. Seal for the measuring cell
3. Process fitting
4. Additional, front seal for measuring cell
5. Diaphragm
5. Hole for leakage detection

3.3 Packaging, transport and storage

Packaging

Your instrument was protected by packaging during transport. Its capacity to handle normal loads during transport is assured by a test based on ISO 4180.

The packaging of standard instruments consists of environment-friendly, recyclable cardboard. For special versions, PE foam or PE foil is also used. Dispose of the packaging material via specialised recycling companies.

Transport

Transport must be carried out in due consideration of the notes on the transport packaging. Nonobservance of these instructions can cause damage to the device.
The delivery must be checked for completeness and possible transit damage immediately at receipt. Ascertained transit damage or concealed defects must be appropriately dealt with.

Up to the time of installation, the packages must be left closed and stored according to the orientation and storage markings on the outside.

Unless otherwise indicated, the packages must be stored only under the following conditions:

- Not in the open
- Dry and dust free
- Not exposed to corrosive media
- Protected against solar radiation
- Avoiding mechanical shock and vibration

Storage and transport temperature:

- Storage and transport temperature see chapter "Supplement - Technical data - Ambient conditions"
- Relative humidity 20 … 85 %

With instrument weights of more than 18 kg (39.68 lbs) suitable and approved equipment must be used for lifting and carrying.
4 Mounting

4.1 General instructions

Make sure before mounting that all parts of the instrument exposed to the process are suitable for the existing process conditions.

These are mainly:
- Active measuring component
- Process fitting
- Process seal

Process conditions in particular are:
- Process pressure
- Process temperature
- Chemical properties of the medium
- Abrasion and mechanical influences

You can find detailed information on the process conditions in chapter "Technical data" as well as on the type label.

Protection against moisture

Protect your instrument against moisture ingress through the following measures:
- Use a suitable connection cable (see chapter "Connecting to power supply")
- Tighten the cable gland or plug connector
- When mounting horizontally, turn the housing so that the cable gland or plug connector point downward
- Lead the connection cable downward in front of the cable entry or plug connector

This applies mainly to outdoor installations, in areas where high humidity is expected (e.g. through cleaning processes) and on cooled or heated vessels.

To maintain the housing protection, make sure that the housing lid is closed during operation and locked, if necessary.

Make sure that the degree of contamination specified in chapter "Technical data" meets the existing ambient conditions.

Screwing in

On devices with a threaded fitting, the hexagon on the process fitting must be tightened with a suitable wrench.

See chapter "Dimensions" for wrench size.

Warning:
The housing or the electrical connection may not be used for screwing in! Tightening can cause damage, e.g. to the rotation mechanism of the housing.

Vibrations

If there is strong vibration at the mounting location, the instrument version with external housing should be used. See chapter "External housing".
4 Mounting

Process pressure range - Mounting accessory
The permissible process pressure range is stated on the type label. The instrument should only be operated with these pressures if the mounting accessory used also fulfills these values. This should be ensured by suitable flanges, welded sockets, tension rings with Clamp connections, sealings, etc.

Temperature limits
Higher process temperatures often mean also higher ambient temperatures. Make sure that the upper temperature limits stated in chapter "Technical data" for the environment of the electronics housing and connection cable are not exceeded.

![Fig. 10: Temperature ranges](image)

1 Process temperature
2 Ambient temperature

4.2 Ventilation and pressure compensation
The filter element in the electronics housing has the following functions:

- Ventilation of the electronics housing
- Atmospheric pressure compensation (with relative pressure measuring ranges)

Caution:
The filter element causes a time-delayed pressure compensation. When quickly opening/closing the housing cover, the measured value can change for approx. 5 s by up to 15 mbar.

For an effective ventilation, the filter element must be always free from buildup. In case of horizontal mounting, turn the housing so that the filter element points downward after the instrument is installed. This provides better protection against buildup.

Caution:
Do not use a high-pressure cleaner. The filter element could be damaged, which would allow moisture into the housing.

The following paragraphs describe how the filter element is arranged in the different instrument versions.
Filter element - Position

Fig. 11: Position of the filter element
1 Plastic, stainless steel single chamber (precision casting)
2 Aluminium - single chamber
3 Stainless steel single chamber (electropolished)
4 Plastic double chamber
5 Aluminium - double chamber
6 Filter element

With the following instruments a blind plug is installed instead of the filter element:
- Instruments in protection IP 66/IP 68 (1 bar) - ventilation via capillaries in non-detachable cable
- Instruments with absolute pressure

Filter element - Position
Ex-d version

→ Turn the metal ring in such a way that the filter element points downward after installation of the instrument. This provides better protection against buildup.

Fig. 12: Position of the filter element - Ex-d version
1 Rotatable metal ring
2 Filter element

Instruments with absolute pressure have a blind plug mounted instead of the filter element.
4 Mounting

Filter element - Position
Second Line of Defense

The Second Line of Defense (SLOD) is a second level of the process separation in form of a gas-tight leadthrough in the housing neck, preventing products from penetrating into the housing.

With these instruments, the process assembly is completely encapsulated. An absolute pressure measuring cell is used so that no ventilation is required.

With relative pressure measuring ranges, the ambient pressure is detected and compensated by a reference sensor in the electronics.

![Fig. 13: Position of the filter element - gastight leadthrough](image)

1. Filter element
2. Gas-tight leadthrough

Filter element - Position
IP 69K version

![Fig. 14: Position of the filter element - IP 69K version](image)

1. Filter element

Instruments with absolute pressure have a blind plug mounted instead of the filter element.

4.3 Process pressure measurement

Keep the following in mind when setting up the measuring system:

- Mount the instrument above the measuring point

Possible condensation can then drain off into the process line.
Keep the following in mind when setting up the measuring system:

- Connect via a siphon
- Do not insulate the siphon
- Fill the siphon with water before setup

A protective accumulation of water is formed through condensation in the pipe bends. Even in applications with hot steam, a medium temperature $< 100 \, ^\circ\text{C}$ on the transmitter is ensured.
4 Mounting

**Measurement setup in liquids**

Keep the following in mind when setting up the measuring system:

- Mount the instrument below the measuring point

The effective pressure line is always filled with liquid and gas bubbles can bubble up to the process line.

![Diagram](image1.png)

*Fig. 17: Measurement setup for process pressure measurement of liquids in pipelines*

1. CPT-2x
2. Blocking valve
3. Pipeline

**Measurement setup**

Keep the following in mind when setting up the measuring system:

- Mount the instrument below the min. level
- Do not mount the instrument close to the filling stream or emptying area
- Mount the instrument so that it is protected against pressure shocks from the stirrer

![Diagram](image2.png)

*Fig. 18: Measurement setup for level measurement*

Fig. 19: Configuration, process module, external housing

1 Pipeline
2 Process module
3 Connection cable process assembly - External housing
4 External housing
5 Signal cable
5 Connecting to the bus system

5.1 Preparing the connection

Safety instructions
Always keep in mind the following safety instructions:

- Carry out electrical connection by trained, qualified personnel authorised by the plant operator
- If overvoltage surges are expected, overvoltage arresters should be installed

⚠️ Warning:
Connect only in the complete absence of line voltage.

Voltage supply
The instrument requires a operating voltage of 9 ... 32 V DC. Operating voltage and the digital bus signal are carried on the same two-wire connection cable. Power is supplied via the H1 power supply.

Connection cable
Connection is carried out with screened cable according to Fieldbus specification.

- Use cable with round cross section for instruments with housing and cable gland. To ensure the seal effect of the cable gland (IP protection rating), find out which cable outer diameter the cable gland is suitable for.
- Use a cable gland fitting the cable diameter.
- Make sure that the entire installation is carried out according to the Fieldbus specification. In particular, make sure that the bus is terminated with suitable terminating resistors.

Cable screening and grounding
Make sure that the cable screen and grounding are carried out according to Fieldbus specification. We recommend to connect the cable screening to ground potential on both ends.

- In systems with potential equalisation, connect the cable screening directly to ground potential at the power supply unit, in the connection box and at the sensor. The screen in the sensor must be connected directly to the internal ground terminal. The ground terminal outside on the housing must be connected to the potential equalisation (low impedance).

Cable glands

Metric threads
In the case of instrument housings with metric thread, the cable glands are screwed in at the factory. They are sealed with plastic plugs as transport protection.

- You have to remove these plugs before electrical connection.

NPT thread
In the case of instrument housings with self-sealing NPT threads, it is not possible to have the cable entries screwed in at the factory. The free openings for the cable glands are therefore covered with red dust protection caps as transport protection.

- Prior to setup you have to replace these protective caps with approved cable glands or close the openings with suitable blind plugs.
On plastic housings, the NPT cable gland or the Conduit steel tube must be screwed into the threaded insert without grease.
Max. torque for all housings, see chapter "Technical data".

5.2 Connecting

The voltage supply and signal output are connected via the spring-loaded terminals in the housing.
Connection to the display and adjustment module or to the interface adapter is carried out via contact pins in the housing.

Information:
The terminal block is pluggable and can be removed from the electronics. To do this, lift the terminal block with a small screwdriver and pull it out. When reinserting the terminal block, you should hear it snap in.

Connection procedure

Proceed as follows:
1. Unscrew the housing lid
2. If a display and adjustment module is installed, remove it by turning it slightly to the left
3. Loosen compression nut of the cable gland and remove blind plug
4. Remove approx. 10 cm (4 in) of the cable mantle, strip approx. 1 cm (0.4 in) of insulation from the ends of the individual wires
5. Insert the cable into the sensor through the cable entry
6. Insert the wire ends into the terminals according to the wiring plan

Information:
Solid cores as well as flexible cores with wire end sleeves are inserted directly into the terminal openings. In case of flexible cores without end sleeves, press the terminal from above with a small screwdriver, the terminal opening is then free. When the screwdriver is released, the terminal closes again.
You can find further information on the max. wire cross-section under "Technical data - Electromechanical data".

Fig. 20: Connection steps 5 and 6
1 Single chamber housing
2 Double chamber housing
5 Connecting to the bus system

7. Check the hold of the wires in the terminals by lightly pulling on them
8. Connect the screen to the internal ground terminal, connect the external ground terminal to potential equalisation
9. Tighten the compression nut of the cable entry gland. The seal ring must completely encircle the cable
10. Reinsert the display and adjustment module, if one was installed
11. Screw the housing lid back on

The electrical connection is finished.

5.3 Single chamber housing

The following illustration applies to the non-Ex, Ex-ia and Ex-d version.

2 Contact pins for the display and adjustment module or interface adapter
3 Simulation switch ("1" = mode for simulation release)
4 For external display and adjustment unit
5 Ground terminal for connection of the cable screening

5.8 Switch-on phase

After connecting the instrument to power supply or after a voltage recurrence, the instrument carries out a self-check for approx. 5 s:
- Internal check of the electronics
- Indication of a status message on the display or PC
5 Connecting to the bus system

- Output signal at instruments with current output jumps to the set fault current

Then the actual measured value is output to the signal cable. The value takes into account settings that have already been carried out, e.g. default setting.
6 Set up with the display and adjustment module

6.1 Insert display and adjustment module

The display and adjustment module can be inserted into the sensor and removed again at any time. You can choose any one of four different positions - each displaced by 90°. It is not necessary to interrupt the power supply.

Proceed as follows:

1. Unscrew the housing lid
2. Place the display and adjustment module on the electronics in the desired position and turn it to the right until it snaps in.
3. Screw housing lid with inspection window tightly back on

Disassembly is carried out in reverse order.

The display and adjustment module is powered by the sensor, an additional connection is not necessary.

Fig. 33: Display and adjustment elements
1 LC display
2 Adjustment keys

Key functions

- **[OK]** key:
  - Move to the menu overview
  - Confirm selected menu
  - Edit parameter
  - Save value

- **[->]** key:
  - Change measured value presentation
  - Select list entry
  - Select menu items

Note:
If you intend to retrofit the instrument with a display and adjustment module for continuous measured value indication, a higher lid with an inspection glass is required.
6 Set up with the display and adjustment module

- Select editing position
- **[+]** key:
  - Change value of the parameter
- **[ESC]** key:
  - Interrupt input
  - Jump to next higher menu

### Adjustment system
The instrument is operated via the four keys of the display and adjustment module. The individual menu items are shown on the LC display. You can find the function of the individual keys in the previous illustration.

### Time functions
When the [+] and [->] keys are pressed quickly, the edited value, or the cursor, changes one value or position at a time. If the key is pressed longer than 1 s, the value or position changes continuously.

When the **[OK]** and **[ESC]** keys are pressed simultaneously for more than 5 s, the display returns to the main menu. The menu language is then switched over to "English".

Approx. 60 minutes after the last pressing of a key, an automatic reset to measured value indication is triggered. Any values not confirmed with **[OK]** will not be saved.

### 6.3 Measured value indication
With the [->] key you can move between three different indication modes.

In the first view, the selected measured value is displayed in large digits.

In the second view, the selected measured value and a corresponding bar graph presentation are displayed.

In the third view, the selected measured value as well as a second selectable value, e.g. the temperature, are displayed.

![Measured value indication](image)

With the "OK" key you move (during the initial setup of the instrument) to the selection menu "Language".

### Selection language
In this menu item, you can select the national language for further parameterization.

![Selection language](image)

With the "[->]" button, you can select the requested language, with "OK" you confirm the selection and move to the main menu.
You can change your selection afterwards with the menu item "Setup - Display, Menu language".

### 6.4 Parameter adjustment - Quick setup

To quickly and easily adapt the sensor to the application, select the menu item "Quick setup" in the start graphic on the display and adjustment module.

Select the individual steps with the [->] key.

After the last step, "Quick setup terminated successfully" is displayed briefly.

The return to the measured value indication is carried out through the [->] or [ESC] keys or automatically after 3 s

**Note:**
You can find a description of the individual steps in the quick setup guide of the sensor.

You can find "Extended adjustment" in the next sub-chapter.

### 6.5 Parameter adjustment - Extended adjustment

For technically demanding measuring points, you can carry out extended settings in "Extended adjustment".

The main menu is divided into five sections with the following functions:

**Setup:** Settings, e.g., for measurement loop name, application, units, position correction, adjustment, signal output

**Display:** Settings, e.g., for language, measured value display, lighting

**Diagnostics:** Information, e.g., on instrument status, pointer, measurement reliability, simulation

**Additional adjustments:** PIN, date/time, reset, copy function

**Info:** Instrument name, hardware and software version, date of manufacture, device ID, sensor features

**Note:**
For optimum adjustment of the measuring point, the individual sub-menu items in the main menu item "Setup" should be selected one
after the other and provided with the correct parameters. If possible, go through the items in the given sequence.

The procedure is described below.

The following submenu points are available:

**Setup - Application**

In this menu item you activate/deactivate the slave sensor for electronic differential pressure and select the application.

CPT-2x can be used for process pressure and level measurement. Default setting is process pressure measurement. The mode can be changed in this adjustment menu.

If you have connected no slave sensor, you confirm this with "Deactivate".

Depending on the selected application, different subchapters in the following adjustment steps are important. There you can find the individual adjustment steps.

Enter the requested parameters via the appropriate keys, save your settings with [OK] and jump to the next menu item with the [ESC] and the [->] key.

**Setup - Units**

In this menu item, the adjustment units of the instrument are determined. The selection determines the unit displayed in the menu items "Min. adjustment (Zero)" and "Max. adjustment (Span)".

**Unit of measurement:**

If the level should be adjusted in a height unit, the density of the medium must also be entered later during the adjustment.

In addition, the temperature unit of the instrument is specified. The selection determines the unit displayed in menu items "Peak value, temperature" and "in the variables of the digital output signal".
6 Set up with the display and adjustment module

Enter the requested parameters via the appropriate keys, save your settings with [OK] and jump to the next menu item with the [ESC] and the [->] key.

Setup - Position correction

Especially with chemical seal systems, the installation position of the instrument can shift (offset) the measured value. Position correction compensates this offset. In the process, the actual measured value is taken over automatically. With relative pressure measuring cells a manual offset can also be carried out.

Note:
If the current measured value is automatically accepted, it must not be falsified by medium coverage or static pressure.

With the manual position correction, the offset value can be determined by the user. Select for this purpose the function "Edit" and enter the requested value.

Save your settings with [OK] and move with [ESC] and [->] to the next menu item.

After the position correction is carried out, the actual measured value is corrected to 0. The corrective value appears with an inverse sign as offset value in the display.

The position correction can be repeated as often as necessary. However, if the sum of the corrective values exceeds 20 % of the nominal measuring range, then no position correction is possible.

Setup - Adjustment

CPT-2x always measures pressure independently of the process variable selected in the menu item "Application". To output the selected process variable correctly, an allocation of the output signal to 0 % and 100 % must be carried out (adjustment).

With the application "Level", the hydrostatic pressure, e.g. with full and empty vessel, is entered for adjustment. See following example:
Set up with the display and adjustment module

Fig. 34: Parameter adjustment example "Min./max. adjustment, level measurement"

1 Min. level = 0 % corresponds to 0.0 mbar
2 Max. level = 100 % corresponds to 490.5 mbar

If these values are not known, an adjustment with filling levels of e.g. 10 % and 90 % is also possible. By means of these settings, the real filling height is then calculated.

The actual product level during this adjustment is not important, because the min./max. adjustment is always carried out without changing the product level. These settings can be made ahead of time without the instrument having to be installed.

**Note:**
If the adjustment ranges are exceeded, the entered value will not be accepted. Editing can be interrupted with [ESC] or corrected to a value within the adjustment ranges.

For the other process variables such as e.g. process pressure, differential pressure or flow, the adjustment is performed in like manner.

**Setup - Zero adjustment**

Proceed as follows:

1. Select the menu item "Setup" with [->] and confirm with [OK].
   Now select with [->] the menu item "Zero adjustment" and confirm with [OK].

2. Edit the mbar value with [OK] and set the cursor to the requested position with [->].

3. Set the requested mbar value with [+] and store with [OK].
4. Go with [ESC] and [->] to the span adjustment
   The zero adjustment is finished.

**Information:**
The Zero adjustment shifts the value of the span adjustment. The span, i.e. the difference between these values, however, remains unchanged.

For an adjustment with pressure, simply enter the actual measured value indicated at the bottom of the display.

If the adjustment ranges are exceeded, the message "Outside parameter limits" appears. The editing procedure can be aborted with [ESC] or the displayed limit value can be accepted with [OK].

**Setup - Span adjustment**
Proceed as follows:
1. Select with [->] the menu item Span adjustment and confirm with [OK].

   ![Span Adjustment](image)

2. Edit the mbar value with [OK] and set the cursor to the requested position with [->].

   ![Span Value](image)

3. Set the requested mbar value with [+] and store with [OK].
   For an adjustment with pressure, simply enter the actual measured value indicated at the bottom of the display.
   If the adjustment ranges are exceeded, the message "Outside parameter limits" appears. The editing procedure can be aborted with [ESC] or the displayed limit value can be accepted with [OK].
   The span adjustment is finished.

**Setup - Min. adjustment Level**
Proceed as follows:
1. Select the menu item "Setup" with [->] and confirm with [OK].
   Now select with [->] the menu item "Adjustment", then "Min. adjustment" and confirm with [OK].

   ![Min. Adjustment](image)

2. Edit the percentage value with [OK] and set the cursor to the requested position with [->].

3. Set the requested percentage value (e.g. 10 %) with [+] and save with [OK]. The cursor jumps now to the pressure value.

4. Enter the pressure value corresponding to the min. level (e.g. 0 mbar).
5. Save settings with [OK] and move with [ESC] and [-->] to the max. adjustment.

The min. adjustment is finished.

For an adjustment with filling, simply enter the actual measured value indicated at the bottom of the display.

**Setup - Max. adjustment**

**Level**

Proceed as follows:

1. Select with [-->] the menu item Max. adjustment and confirm with [OK].

2. Edit the percentage value with [OK] and set the cursor to the requested position with [-->].

3. Set the requested percentage value (e.g. 90 %) with [++] and save with [OK]. The cursor jumps now to the pressure value.

4. Enter the pressure value for the full vessel (e.g. 900 mbar) corresponding to the percentage value.

5. Save settings with [OK]

The max. adjustment is finished.

For an adjustment with filling, simply enter the actual measured value indicated at the bottom of the display.

**Setup - Damping**

To damp process-dependent measured value fluctuations, set an integration time of 0 … 999 s in this menu item. The increment is 0.1 s.

The setting in the delivery status depends on the sensor type.

**Setup - Linearisation**

A linearization is necessary for all vessels in which the vessel volume does not increase linearly with the level - e.g. a horizontal cylindrical or spherical tank - and the indication or output of the volume is required. Corresponding linearization curves are preprogrammed for these vessels. They represent the correlation between the level percentage and vessel volume. The linearization applies to the measured value indication and the current output.

**Lock/unlock setup - Adjustment**

In the menu item "Lock/unlock adjustment" you safeguard the sensor parameters against unauthorized or unintentional modifications.
6 Set up with the display and adjustment module

With active PIN, only the following adjustment functions are possible without entering a PIN:

- Select menu items and show data
- Read data from the sensor into the display and adjustment module

Releasing the sensor adjustment is also possible in any menu item by entering the PIN.

Caution:
With active PIN, adjustment via PACTware/DTM and other systems is also blocked.

Display - Language
This menu item enables the setting of the requested national language.

The following languages are available:
- German
- English
- French
- Spanish
- Russian
- Italian
- Dutch
- Portuguese
- Japanese
- Chinese
- Polish
- Czech
- Turkish

In delivery status, the CPT-2x is set to English.

Display - Displayed value 1 and 2
In this menu item, you define which measured value is displayed.

The default setting for the display value is "Lin. percent".

Display - Display format 1 and 2
In this menu item you define the number of decimal positions with which the measured value is displayed.
The default setting for the display format is "Automatic".

### Display - Backlight

The display and adjustment module has a backlight for the display. In this menu item you can switch on the lighting. You can find the required operating voltage in chapter "Technical data".

In delivery status, the lighting is switched on.

### Diagnostics - Device status

In this menu item, the device status is displayed.

In case of error, e.g. the error code F017, e.g. the error description "Adjustment span too small" and a four digit figure are displayed for service purposes. You can find the error codes with description, reason as well as rectification in chapter "Asset Management".

### Diagnostics - Peak values, pressure

The respective min. and max. measured values are saved in the sensor. The two values are displayed in menu item "Peak values, pressure".

In another window you can carry out a reset of the peak values separately.

### Diagnostics - Peak values, temperature

The respective min. and max. measured values of the measuring cell and the electronics temperature are stored in the sensor. In menu item "Peak value, temperature", both values are displayed.

In another window you can carry out a reset of the two peak values separately.

### Diagnosis - Simulation

In this menu item you simulate measured values. Hence, the signal path can be tested via the bus system to the input card of the control system.
Select the requested simulation variable and set the requested value.
To deactivate the simulation, you have to push the [ESC] key and confirm the message "Deactivate simulation" with the [OK] key.

**Caution:**
During simulation, the simulated value is output as digital signal.
The status message along with the Asset Management function is "Maintenance".

**Information:**
The sensor terminates the simulation automatically after 60 minutes.

### Additional settings - Date/Time
In this menu item, you adjust the internal clock of the sensor. There is no adjustment for summer/winter (daylight saving) time.

### Additional settings - Reset
After a reset, certain parameter adjustments made by the user are reset.

The following reset functions are available:

**Delivery status:** Restores the parameter settings at the time of shipment from the factory, incl. the order-specific settings. Any user-defined linearisation curve as well as the measured value memory are deleted.

**Basic settings:** Resets the parameter settings, incl. special parameters, to the default values of the respective instrument. Any programmed linearisation curve as well as the measured value memory are deleted.

The following table shows the default values of the instrument. Depending on the instrument version or application, all menu items may not be available or some may be differently assigned:
# 6 Set up with the display and adjustment module

Scaling format | 0 % corresponds to 0 l 
100 % corresponds to 0 l

Additional settings - Copy instrument settings

The instrument settings are copied with this function. The following functions are available:

- **Read from sensor**: Read data from sensor and store into the display and adjustment module
- **Write into sensor**: Store data from the display and adjustment module back into the sensor

The following data or settings for adjustment of the display and adjustment module are saved:

- All data of the menu "Setup" and "Display"
- In the menu "Additional adjustments" the items "Reset, Date/Time"
- The user-programmable linearization curve

The copied data are permanently saved in an EEPROM memory in the display and adjustment module and remain there even in case of power failure. From there, they can be written into one or more sensors or kept as backup for a possible electronics exchange.

**Note:**

Before the data are saved in the sensor, a safety check is carried out to determine if the data match the sensor. In the process the sensor type of the source data as well as the target sensor are displayed. If the data do not match, a fault message is outputted or the function is blocked. The data are saved only after release.

Additional settings - Special parameters

In this menu item you gain access to the protected area where you can enter special parameters. In exceptional cases, individual parameters can be modified in order to adapt the sensor to special requirements.

Change the settings of the special parameters only after having contacted our service staff.

Info - Instrument name

In this menu item, you can read out the instrument name and the instrument serial number:
6 Set up with the display and adjustment module

**Info - Instrument version**
In this menu item, the hardware and software version of the sensor is displayed.

**Info - Factory calibration date**
In this menu item, the date of factory calibration of the sensor as well as the date of the last change of sensor parameters are displayed via the display and adjustment module or via the PC.

**Info - Device ID**
In this menu item, the identification number of the instrument in a Foundation Fieldbus system is shown.

**Info - Sensor characteristics**
In this menu item, the features of the sensor such as approval, process fitting, seal, measuring range, electronics, housing and others are displayed.

### 6.6 Saving the parameterisation data

**On paper**
We recommended writing down the adjustment data, e.g. in this operating instructions manual, and archiving them afterwards. They are thus available for multiple use or service purposes.

**In the display and adjustment module**
If the instrument is equipped with a display and adjustment module, the parameter adjustment data can be saved therein. The procedure is described in menu item "Copy device settings".
7 Setup with PACTware

7.1 Parameter adjustment
The further setup steps with detailed descriptions can be found in the online help of PACTware and the DTMs.

**Note:**
Keep in mind that for the setup of model CPT-2x, the current version of the DTM-Collection must be used.

The latest DTM Collection and PACTware version can be downloaded free of charge via the Internet.

7.2 Saving the parameterisation data
We recommend documenting or saving the parameterisation data via PACTware. That way the data are available for multiple use or service purposes.
8 Diagnosis, asset management and service

8.1 Maintenance

If the device is used properly, no special maintenance is required in normal operation.

Precaution measures against buildup

In some applications, product buildup on the diaphragm can influence the measuring result. Depending on the sensor and application, take precautions to ensure that heavy buildup, and especially a hardening thereof, is avoided.

Cleaning

The cleaning helps that the type label and markings on the instrument are visible.

Take note of the following:

- Use only cleaning agents which do not corrode the housings, type label and seals
- Use only cleaning methods corresponding to the housing protection rating

8.2 Cleaning - hygienic connection with compression nut

Overview

The hygienic connection with compression nut can be disassembled and the diaphragm cleaned.

The following graphic shows the structure:

![Diagram of CPT-2x, structure of the hygienic connection with compression nut]

Fig. 35: CPT-2x, structure of the hygienic connection with compression nut

1. Hexagon
2. Compression nut
3. Process fitting
4. Process module
5. Form seal for the measuring cell
6. O-ring seal for the process fitting
7. Diaphragm

Procedure

To do so, proceed as follows:

1. Loosen compression nut and remove the pressure transmitter from the welded socket
2. Remove the O-ring seal for the process fitting
3. Clean the diaphragm with brass brush and cleaning detergent
4. Loosen the hexagon and remove the process component from the process fitting
5. Remove the form seal for the measuring cell and remove it by a new one
6. Screw the process component into the process fitting, tighten the hexagon (wrench size see chapter "Dimensions", max. torque see chapter "Technical data")
7. Insert new O-ring seal for the process fitting
8. Install the process pressure transmitter in the welded socket, tighten compression nut

The cleaning is finished.
The pressure transmitter is directly ready for operation, a fresh adjustment is not required.

8.3 Diagnosis memory

The instrument has several memories available for diagnostic purposes. The data remain there even in case of voltage interruption.

Measured value memory

Up to 100,000 measured values can be stored in the sensor in a ring memory. Each entry contains date/time as well as the respective measured value.

Depending on the instrument version, values that can be stored are for example:

- Level
- Process pressure
- Differential pressure
- Static pressure
- Percentage value
- Scaled values
- Current output
- Lin. percent
- Measuring cell temperature
- Electronics temperature

When the instrument is shipped, the measured value memory is active and stores pressure value and measuring cell temperature every 10 s, with electronic differential pressure also the static pressure.

The requested values and recording conditions are set via a PC with PACTware/DTM or the control system with EDD. Data are thus read out and also reset.

Event memory

Up to 500 events are automatically stored with a time stamp in the sensor (non-deletable). Each entry contains date/time, event type, event description and value. Event types are for example:

- Modification of a parameter
- Switch-on and switch-off times
- Status messages (according to NE 107)
- Error messages (according to NE 107)

The data are read out via a PC with PACTware/DTM or the control system with EDD.
### 8.4 Asset Management function

**Monitoring and output**

The device is equipped with self-monitoring and diagnostics in accordance with NE 107 and VDI/VDE 2650. The operating status is output via status messages. Depending on instrument type and version, this is done via display and adjustment unit, VEGA Tools app, PACTware/DTM or EDD or LED illuminated ring.

**Status messages**

The status messages are divided into the following categories:

- Failure
- Function check
- Out of specification
- Maintenance requirement

and explained by pictographs:

```
1  Failure - red
2  Out of specification - yellow
3  Function check - orange
4  Maintenance - blue
```

**Failure:** Due to a malfunction in the instrument, a fault message is output. This status message is always active. It cannot be deactivated by the user.

**Function check:** The instrument is being worked on, the measured value is temporarily invalid (for example during simulation). This status message is inactive by default. It can be activated by the user via PACTware/DTM or EDD.

**Out of specification:** The measured value is unreliable because an instrument specification was exceeded (e.g. electronics temperature). This status message is inactive by default. It can be activated by the user via PACTware/DTM or EDD.

**Maintenance:** Due to external influences, the instrument function is limited. The measurement is affected, but the measured value is still valid. Plan in maintenance for the instrument because a failure is expected in the near future (e.g. due to buildup). This status message is inactive by default. It can be activated by the user via PACTware/DTM or EDD.

| M502 | Error in the event memory | ● Hardware error EEPROM | ● Exchanging the electronics  
● Send instrument for repair | Bit 17 |
| M504 | Error at a device interface | ● Hardware defect | ● Exchanging the electronics  
● Send instrument for repair | Bit 19 |
| M507 | Error in the instrument settings | ● Error during setup  
● Error when carrying out a reset | ● Carry out reset and repeat setup | Bit 22 |

Tab. 8: Error codes and text messages, information on causes as well as corrective measures

---

### 8.5 Rectify faults

The operator of the system is responsible for taking suitable measures to rectify faults.

#### Reaction when malfunction occurs

The first measures are:

- Evaluation of fault messages
- Checking the output signal
- Treatment of measurement errors

A smartphone/tablet with the VEGA Tools app or a PC/notebook with the software PACTware and the suitable DTM offer you further comprehensive diagnostic possibilities. In many cases, the causes can be determined in this way and the faults eliminated.

#### Fault rectification

Depending on the reason for the fault and the measures taken, the steps described in chapter "Setup" must be carried out again or must be checked for plausibility and completeness.

---

### 8.6 Exchange process module on version IP 68 (25 bar)

On version IP 68 (25 bar), the user can exchange the process module on site. Connection cable and external housing can be kept.

#### Required tools:

- Hexagon key wrench, size 2

#### Caution:

The exchange may only be carried out in the complete absence of line voltage.

In Ex applications, only a replacement part with appropriate Ex approval may be used.
Caution:
During exchange, protect the inner side of the parts against contamination and moisture.

Proceed as follows when carrying out the exchange:
1. Loosen the fixing screw with the hexagon key wrench
2. Carefully detach the cable assembly from the process module

Fig. 37: CPT-2x in IP 68 version, 25 bar and lateral cable outlet, external housing

1 Process module
2 Plug connector
3 Fixing screw
4 Cable assembly
5 Connection cable
6 External housing

3. Loosen the plug connector
4. Mount the new process module on the measuring point
5. Plug the connector back in
6. Mount the cable assembly on the process module and turn it to the desired position
7. Tighten the fixing screw with the hexagon key wrench

The exchange is finished.

8.7 Instrument repair
You can find information for a return shipment under "Service" on our local website.

If a repair is necessary, please proceed as follows:
- Complete one form for each instrument
- If necessary, state a contamination
- Clean the instrument and pack it damage-proof
- Attach the completed form and possibly also a safety data sheet to the instrument
9 Dismount

9.1 Dismounting steps

Warning:
Before dismounting, be aware of dangerous process conditions such as e.g. pressure in the vessel or pipeline, high temperatures, corrosive or toxic products etc.

Take note of chapters "Mounting" and "Connecting to voltage supply" and carry out the listed steps in reverse order.

9.2 Disposal

The instrument consists of materials which can be recycled by specialised recycling companies. We use recyclable materials and have designed the electronics to be easily separable.

WEEE directive
The instrument does not fall in the scope of the EU WEEE directive. Article 2 of this Directive exempts electrical and electronic equipment from this requirement if it is part of another instrument that does not fall in the scope of the Directive. These include stationary industrial plants.

Pass the instrument directly on to a specialised recycling company and do not use the municipal collecting points.

If you have no way to dispose of the old instrument properly, please contact us concerning return and disposal.

Materials, wetted parts

Process fitting: 316L, PVDF, Alloy C22 (2.4602), Alloy C276 (2.4819), Duplex steel (1.4462), Titanium Grade 2
Diaphragm: Sapphire-ceramic® (> 99.9 % Al₂O₃ ceramic)
Joining material measuring cell: Glass (with double and form seal, non-wetted parts)
Measuring cell seal
  - Standard (O-ring seal): FKM (VP2/A, A+P 70.16), EPDM (A+P 70.10-02), FFKM (Kalrez 6375, Perlast G75S, Perlast G75B)
  - Hygienic fitting with compression nut (form seal): FKM (ET 6067), EPDM (EPDM 7076), FFKM (Chemraz 535), FEPM (Fluoraz SD890)
Seal for process fitting (in the scope of delivery)
  - Thread G½ (EN 837), G1½ (DIN 3852-A): Klingersil C-4400
  - Thread M44 x 1.25 (DIN 13), M30 x 1.5: FKM, FFKM, EPDM
  - Hygienic connection with compression nut: FKM, EPDM, FFKM, FEPM
Surface quality, hygienic fittings, typ.
  - Process fitting: Rₐ < 0.8 µm
  - Diaphragm: Rₐ < 0.5 µm

Materials, non-wetted parts

Sensor housing
  - Housing: Plastic PBT (Polyester), Aluminium AlSi10Mg (powder-coated, basis: Polyester), 316L
  - Cable gland: PA, stainless steel, brass
  - Cable gland: Seal, closure: NBR, PA
  - Seal, housing lid: Silicone Si 850 R, NBR silicone-free
  - Inspection window housing cover: Polycarbonate (UL-746-C listed), glass¹)
  - Ground terminal: 316L

External housing - deviating materials
  - Housing and socket: Plastic PBT (Polyester), 316L
  - Socket seal: EPDM
  - Seal below wall mounting plate²): EPDM
  - Inspection window housing cover: Polycarbonate (UL-746-C listed)
  - Ground terminal: 316Ti/316L

¹) Glass with Aluminium and stainless steel precision casting housing
²) Only for 316L with 3A approval
Connection cable with IP 68 (25 bar)\(^3\)
- Cable cover PE, PUR
- Type label support on cable PE hard
Connection cable with IP 68 (1 bar)\(^4\) PE, PUR

**Weights**

Total weight CPT-2x approx. 0.8 ... 8 kg (1.764 ... 17.64 lbs), depending on process fitting and housing

**Torques**

Max. torque for process fitting
- G½, G¾ 30 Nm (22.13 lbf ft)
- Fittings according to 3A with exchangeable sealing 20 Nm (14.75 lbf ft)
- Hygienic fitting with compression nut (hexagon) 40 Nm (29.50 lbf ft)
- G1, M30 x 1.5 50 Nm (36.88 lbf ft)
- G1 for PASVE 100 Nm (73.76 lbf ft)
- G1½ 200 Nm (147.5 lbf ft)

Max. torque for screws
- PMC 1", PMC 1½" 2 Nm (1.475 lbf ft)
- PMC 1½" 5 Nm (3.688 lbf ft)

Max. torque for NPT cable glands and Conduit tubes
- Plastic housing 10 Nm (7.376 lbf ft)
- Aluminium/Stainless steel housing 50 Nm (36.88 lbf ft)

**Input variable**

The specifications are only an overview and refer to the measuring cell. Limitations due to the material and version of the process fitting as well as the selected pressure type are possible. The specifications on the nameplate apply.

### Adjustment ranges

Specifications refer to the nominal measuring range, pressure values lower than -1 bar cannot be set.

Min./Max. adjustment:
- **Percentage value**: -10 … 110 %
- **Pressure value**: -20 … 120 %

Zero/Span adjustment:
- **Zero**: -20 … +95 %
- **Span**: -120 … +120 %
- **Difference between zero and span**: max. 120 % of the nominal range

Max. permissible Turn Down: Unlimited (recommended 20 : 1)
Switch-on phase
Run-up time with operating voltage $U_B$
- $\geq 12$ V DC $\leq 9$ s
- $< 12$ V DC $\leq 22$ s

Output variable
Output signal digital output signal, Foundation Fieldbus protocol
Transmission rate 31.25 Kbit/s
Damping (63% of the input variable) 0 … 999 s, adjustable

Channel Numbers
- Channel 1 Process value
- Channel 8 Electronics temperature

Current value
- Non-Ex, Ex-ia and Ex-d instruments 12 mA, ±0.5 mA

Dynamic behaviour output
Dynamic characteristics depending on medium and temperature

Fig. 38: Behaviour in case of sudden change of the process variable. $t_T$: dead time; $t_A$: rise time; $t_S$: jump response time
1 Process variable
2 Output signal

<table>
<thead>

<td>$\leq 150$ ms</td>
</tr>
<tr>
<td>Step response time</td>
<td>$\leq 80$ ms</td>
<td>$\leq 200$ ms</td>
</tr>
</tbody>
</table>

Damping (63% of the input variable) 0 … 999 s, adjustable via menu item "Damping"

Reference conditions and influencing variables (according to DIN EN 60770-1)
Reference conditions according to DIN EN 61298-1
- Temperature $+15 \ldots +25$ °C ($+59 \ldots +77$ °F)
- Relative humidity 45 ... 75 %
- Air pressure 860 ... 1060 mbar/86 ... 106 kPa (12.5 ... 15.4 psig)

**Determination of characteristics**
Limit point adjustment according to IEC 61298-2

**Characteristic curve**
Linear

**Reference installation position**
upright, diaphragm points downward

**Influence of the installation position**
< 0.2 mbar/20 Pa (0.003 psig)

---

**Reference conditions and influencing variables (according to DIN EN 60770-1)**

Reference conditions according to DIN EN 61298-1
- Temperature +15 ... +25 °C (+59 ... +77 °F)
- Relative humidity 45 ... 75 %
- Air pressure 860 ... 1060 mbar/86 ... 106 kPa (12.5 ... 15.4 psig)

**Determination of characteristics**
Limit point adjustment according to IEC 61298-2

**Characteristic curve**
Linear

**Reference installation position**
upright, diaphragm points downward

**Influence of the installation position**
< 0.2 mbar/20 Pa (0.003 psig)

---

**Deviation (according to IEC 60770-1)**

Specifications refer to the set span. Turn down (TD) is the ratio: nominal measuring range/set span.

<table>
<thead>
<tr>
<th>Accuracy class</th>
<th>Non-linearity, hysteresis and repeatability with TD 1 : 1 up to 5 : 1</th>
<th>Non-linearity, hysteresis and repeatability with 5 : 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.05 %</td>
<td>&lt; 0.05 %</td>

<td>&lt; 0.02 % x TD</td>
</tr>
<tr>
<td>0.2 %</td>
<td>&lt; 0.2 %</td>
<td>&lt; 0.04 % x TD</td>
</tr>
</tbody>
</table>

---

**Influence of the product temperature**

**Thermal change zero signal and output span through product temperature**

Applies to the digital signal output (HART, Profibus PA, Foundation Fieldbus) as well as to the analogue current output 4 ... 20 mA and refers to the set span. Turn down (TD) is the ratio "nominal measuring range/set span".

The thermal change of the zero signal and output span corresponds to the temperature error $F_T$ in chapter "Calculation of the total deviation (according to DIN 16086)".

**Basic temperature error $F_T$**
The basic temperature error in % from the above graphic can increase due to the additional factors, depending on the measuring cell version (factor FMZ) and the Turn Down (factor FTD). The additional factors are listed in the following tables.

**Additional factor through measuring cell version**

<table>
<thead>
<tr>
<th>Measuring cell version</th>
<th>Measuring cell standard, depending on the accuracy class</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0.05 %, 0.1 %</td>
<td>0.2 % (with measuring range 0.1 bar abs)</td>
</tr>
<tr>
<td>Factor FMZ</td>
<td>1</td>
<td>2</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Measuring cell version</th>
<th>Measuring cell climate-compensated, depending on measuring range</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>-1 … 0 bar, -1 … 1.5 bar, 10 bar, 25 bar, 60 bar, 100 bar</td>
<td>-0.5 … 0.5 bar, 1 bar, 2.5 bar</td>
</tr>
<tr>
<td>Factor FMZ</td>
<td>1</td>
<td>2</td>
</tr>
</tbody>
</table>

**Additional factor through Turn Down**

The additional factor FTD through Turn down is calculated according to the following formula:

\[ F_{TD} = 0.5 \times TD + 0.5 \]

In the table, example values for typical Turn downs are listed.

<table>
<thead>
<tr>
<th>Turn Down</th>
<th>TD 1 : 1</th>
<th>TD 2.5 : 1</th>
<th>TD 5 : 1</th>
<th>TD 10 : 1</th>
<th>TD 20 : 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Factor FTD</td>
<td>1</td>
<td>1.75</td>
<td>3</td>
<td>5.5</td>
<td>10.5</td>
</tr>
</tbody>
</table>

**Long-term stability (according to DIN 16086)**

Applies to the respective digital signal output (e.g. HART, Profibus PA) as well as to analogue current output 4 … 20 mA under reference conditions. Specifications refer to the set span. Turn down (TD) is the ratio nominal measuring range/set span.

**SIP process temperature (SIP = Sterilization in place)**

Applies to instruments configurations suitable for vapour, i.e. material measuring cell seal EPDM or FFKM (Perlast G75S).

- Vapour stratification up to 2 h +150 °C (+302 °F)

**Process pressure**

- Permissible process pressure see specification "process pressure" on the type label

**Mechanical stress**

- Vibration resistance 4 g at 5 … 200 Hz according to EN 60068-2-6 (vibration with resonance)
- Shock resistance 50 g, 2.3 ms according to EN 60068-2-27 (mechanical shock)

7) Depending on the instrument version.
8) 2 g with housing version stainless steel double chamber
Electromechanical data - version IP 66/IP 67 and IP 66/IP 68 (0.2 bar)

Options of the cable entry

- Cable entry: M20 x 1.5; ½ NPT
- Cable gland: M20 x 1.5, ½ NPT (cable ø see below table)
- Blind plug: M20 x 1.5; ½ NPT
- Closing cap: ½ NPT

Function blocks

Transducer Block (TB)
The Transducer Block "Analog Input (AI)" takes the original measured value (Secondary Value 2), carries out the min./max. adjustment (Secondary Value 1), carries out a linearization (Primary Value) and makes the values on its output available for further function blocks.

Function block Analog Input (AI)
The function block "Analog Input (AI)" takes the original measured value selected by a Channel Number and makes it available to additional function blocks on its output.

Function block Discret Input (DI)
The function block "Discret Input (DI)" takes the original measured value selected by a Channel Number and makes it available to additional function blocks on its output.

Function block PID Control
The function block "PID Control " is a key component for various tasks in the process automation.
and is used universally, PID blocks can be cascaded if this is necessary or requested due to different time constants with the primary and secondary process measurement.

**Fig. 45: Schematic presentation function block PID Control**

**Function block Output Splitter**

The function block "Output Splitter" generates two control outputs out of one input. Each output is a linear image of a part of the input. A retrograde calculation function is realised by using the linear imaging function inversely. A cascading of several Output Splitters is supported by an integrated decision table for the combinability of inputs and outputs.

**Fig. 46: Schematic presentation function block Output Splitter**

**Function block Signal Characterizer**

The function block "Signal Characterizer" has two channels the outputs of which are not in linear relation with the respective input. The non-linear relation is defined by a look-up table with individually selectable x/y-pairs. The respective input signal is imaged on the corresponding output, hence this function block can be used in a control loop or signal path. Optionally the function axis can be exchanged in channel 2 so that the block can be also used in a reverse control loop.
Function block Integrator

The function block "Integrator" integrates a continuous input signal over the time and sums the results of an impulse input block. It is used as a totalizer up to a reset or as a subtotalizer up to a reference point at which the integrated and accumulated value is compared with the default values. When these default values are reached, digital output signals will be outputted. The integration function is carried out upwardly starting with zero and downwards with a default value. Two flow values are also available so that the net flow volume can be calculated and integrated. This can be used for calculation of volume and mass changes in the vessel or for optimisation of flow controls.

Function block Input Selector

The function block "Input Selector" offers selection possibilities for up to four inputs and generates an output signal according to the selection criteria. Typical input signals are AI blocks. Selection possibilities are maximum, minimum, mean value, average value and first useful signal. Through parameter combination, the block can be used as rotary switch or as preselection switch for the first useful value. Switch information can be received by other input blocks or the user. Mean value selection is also supported.
Function block Arithmetic

The function block "Arithmetic" allows the simple integration of usual metrological calculation functions. The user can select the requested measurement algorithm according to the name without known the formula.

The following algorithms are available:

- Flow compensation, linear
- Flow compensation, square root
- Flow compensation, approximate
- BTU flow
- Traditional Multiply Divide
- Average
- Traditional Summer
- Fourth order polynomial
- Simple HTG compensated level
- Fourth order Polynomial Based on PV

10.3 Calculation of the total deviation

The total deviation of a pressure transmitter indicates the maximum measurement error to be expected in practice. It is also called maximum practical deviation or operational error.
According to DIN 16086, the total deviation $F_{\text{total}}$ is the sum of the basic deviation $F_{\text{perf}}$ and the long-term stability $F_{\text{stab}}$:

$$F_{\text{total}} = F_{\text{perf}} + F_{\text{stab}}$$

The basic deviation $F_{\text{perf}}$ consists of the thermal change of the zero signal and the output span $F_T$ as well as the deviation $F_{Kt}$:

$$F_{\text{perf}} = \sqrt{(F_T)^2 + (F_{Kt})^2}$$

The thermal change of zero signal and output span $F_T$ is specified in chapter "Technical data". The basic temperature error $F_T$ is shown in a graphic. Depending on the measuring cell version and Turn down, this value must be multiplied with the additional factors FMZ and FTD:

$$F_T \times \text{FMZ} \times \text{FTD}$$

Also these values are specified in chapter "Technical data".

This applies for a digital signal output through HART, Profinet PA or Foundation Fieldbus.

With a 4 … 20 mA output, the thermal change of the current output $F_a$ must be added:

$$F_{\text{perf}} = \sqrt{((F_T)^2 + (F_{Kt})^2 + (F_a)^2)}$$

To provide a better overview, the formula symbols are listed together below:

- $F_{\text{total}}$: Total deviation
- $F_{\text{perf}}$: Basic deviation
- $F_{\text{stab}}$: Long-term stability
- $F_T$: Thermal change of zero signal and output span (temperature error)
- $F_{Kt}$: Deviation
- $F_a$: Thermal change of the current output
- FMZ: Additional factor measuring cell version
- FTD: Additional factor Turn down

### 10.4 Practical example

**Data**

Pressure measurement in the pipeline 4 bar (400 KPa)

Product temperature up to 50 °C

CPT-2x with measuring range 10 bar, deviation < 0.2 %, process fitting G1$\frac{1}{2}$ (measuring cell Ø 28 mm)

**1. Calculation of the Turn down**

$$\text{TD} = 10 \text{ bar} / 4 \text{ bar}, \text{TD} = 2.5 : 1$$
2. Determination temperature error $F_T$

![Graph showing temperature error determination](image)

*Fig. 51: Determination of the basic temperature error for the above example: $F_{TBasis} = 0.15\%$*

<table>
<thead>
<tr>

<td>5.5</td>
<td>10.5</td>
</tr>
</tbody>
</table>

*Tab. 23: Determination of the additional factor "turn down" for the above example: $F_{TD} = 1.75$*

$F_T = F_{TBasis} \times F_{MZ} \times F_{TD}$

$F_T = 0.15\% \times 3 \times 1.75$

$F_T = 0.79\%$

3. Determination of deviation and long-term stability

The required values for deviation $F_{KI}$ and long-term stability $F_{stab}$ are available in the technical data:

<table>
<thead>
<tr>
<th>Accuracy class</th>

</tr>
</tbody>
</table>

Tab. 25: Determination of the long-term stability from the table, consideration for one year: \( F_{\text{stab}} = 0.05 \% \times \text{TD} \)

### 4. Calculation of the total deviation - digital signal outputs

1. **Step: Basic deviation** \( F_{\text{perf}} \)

   \[
   F_{\text{perf}} = \sqrt{(F_T)^2 + (F_{KL})^2}
   \]

   \[
   F_T = 0.79 \%
   \]

   \[
   F_{KL} = 0.2 \%
   \]

   \[
   F_{\text{perf}} = \sqrt{(0.79 \%)^2 + (0.2 \%)^2}
   \]

   \[
   F_{\text{perf}} = 0.81 \%
   \]

2. **Step: Total deviation** \( F_{\text{total}} \)

   \[
   F_{\text{total}} = F_{\text{perf}} + F_{\text{stab}}
   \]

   \[
   F_{\text{perf}} = 0.81 \% \text{ (result of step 1)}
   \]

   \[
   F_{\text{stab}} = (0.05 \% \times \text{TD})
   \]

   \[
   F_{\text{stab}} = (0.05 \% \times 2.5)
   \]

   \[
   F_{\text{stab}} = 0.125 \%
   \]

   \[
   F_{\text{total}} = 0.81 \% + 0.125 \% = 0.94 \%
   \]

The example shows that the measurement error in practice can be considerably higher than the basic deviation. Reasons are temperature influence and turn down.

Fig. 62: CPT-2x, flange connection

1  Flange connection according to DIN 2501
2  Flange connection according to ASME B16.5

For the version with temperature range up to 150 °C/302 °F, the measure of length increases by 28 mm (1.1 in).

For the version with "Second Line of Defense", the measure of length increases by 17 mm (0.67 in).
For the version with temperature range up to 150 °C/302 °F, the measure of length increases by 28 mm (1.1 in).

For the version with "Second Line of Defense", the measure of length increases by 17 mm (0.67 in).
CPT-2x, connection acc. to IEC 61518
